It is not even possible to imagine a world without computer in this present era. Computer has become an essential component of human life, to meet the challenge of global competitiveness. It assures high quality service at lower cost. It stores huge amount of data and immediately access the data required, where as in the case of manual system it's difficult to store the past data. The growth of the information technology has influenced the life of human very much. It provides them information at a click of the mouse, increasing the speed of accessing.

This project **EVENTO** is an android and online application in which is used in mainly college fests and events. The main advantage of these applications are speed and accuracy. In present situations in college fests there is lot of time delay occurs and registration of colleges and candidate was very difficult. For using this application it will overcome the problems. We are implementing such a system which is very powerful and user friendly. Quick and advanced search facilities of result, registration, judgment, accommodation, program scheduling also included in this app.

This project will helps the program committees to handle the events easily, by removing the offline spot registration. All we need to do is verify each registration. The app works as following, Most of the college fests are inter-college fests, so students of various college and of hosting college has to waste a lot of time before the registration desk, here we make all the registrations online and proceed to payment section (paypal/paytm/credit/debit/spot payment) (for paid events). The application wont be fully available unless the registration desk confirms the registration. After the successful registrations the students/participants can register the events by scanning the QR code corresponding to the events (QR codes will be made available in Websites as well as a hard copy will be pasted at different spots of the venue). Students who wants to participate certain events can scan the QR and will be registered, as simple as that. The participants will be verified manually using college IDs before the event starts. The app also provides notifications about the events, timing, results etc. This app can also reduce the rush at result publish. With this is app, and website, hosting a event becomes even more relaxed.
